

MOHAMMAD WALIDUDDIN

437-260-8096 | walid40@my.yorku.ca | [LinkedIn](#) | [GitHub](#) | [Portfolio](#)

EDUCATION

York University

Bachelor of Engineering in Software Engineering, Specialized Honours

Toronto, Ontario

Sept. 2022 – Expected Dec. 2027

EXPERIENCE

Analyst Intern, Software Engineering (Incoming)

Incoming Sept. 2026

Deloitte Canada – Innovation CoE

Toronto, Ontario

- Joining the team that builds internal AI tooling on Azure – retrieval pipelines, agents, and document and image understanding used by consultants on live client engagements.

Software Developer Co-op

Sept. 2025 – Aug. 2026

Ontario Government – CDIS Application

Toronto, Ontario

- Shipped agentic GenAI workflows to production on Azure, orchestrating multi-agent pipelines with LangGraph, AutoGen, and Azure AI Foundry that developers use daily for issue triage, code generation, and automated review.
- Piloted GitHub Copilot agents with Microsoft engineers to modernize a 700K+ LOC legacy system, building task-aware model routing that cut token usage and latency for users across 3 ministry programs.
- Owned an Azure SQL migration of a legacy production database end to end – schema mapping, cutover plan, and automated validation checks that caught data issues before they reached users.
- Built and shipped 40+ reusable Angular and Spring Boot components, working with 4 teams from first conversation through release rather than handing specs over a wall.

Application Engineer

Sept. 2024 – Dec. 2024

CIBC – Canadian Imperial Bank of Commerce – ECIF Platform

Toronto, Ontario

- Worked across the stack – frontend, backend microservices, and QA – on the customer system of record serving 4,000+ frontline staff, picking up whatever the release needed rather than staying in one lane.
- Built a Java, SQL, and Jenkins pipeline that generates 8 weekly finance reports, deleting 15+ hours per week of manual querying for 20+ analysts.
- Implemented and tested service and schema changes to consent, permissions, and access-control logic, debugging and validating each change in production across 2 releases.
- Delivered name-change handling across 3 legacy banking systems, wiring up the integration points between services and verifying behaviour end to end.

PROJECTS

CLAI Agentic Developer Platform | Python, LangGraph, AutoGen, MCP, RAG, Docker

[GitHub](#)

- Built an end-to-end platform that connects LLMs to repositories, databases, APIs, and MCP-compatible tools through RAG, persistent state, tool calling, and structured outputs.
- Added multi-agent workflows, model routing, and evaluation traces for groundedness, tool success, latency, and cost, so behaviour is measured rather than demoed.

REAI Real Estate Predictor | Python, XGBoost, Optuna, Flask, Docker, GCP

[Live Link](#)

- Shipped and still runs a public price-prediction app: an Optuna-tuned XGBoost model (R^2 0.91) trained on 50K+ Canadian listings, served through a Dockerized, rate-limited Flask API.

SKILLS

Languages: TypeScript, JavaScript, Python, Java, SQL, C#

Web & Services: React, Angular, Node, Spring Boot, Flask, REST APIs, microservices, PostgreSQL, Redis, Neo4j

AI Engineering: RAG, LangGraph, AutoGen, MCP, intelligent agents, embeddings, tool calling, structured outputs, Azure AI Foundry, GitHub Copilot agents

Infrastructure & Testing: Docker, Kubernetes, Jenkins, Azure, AWS, GCP, CI/CD, JUnit, Cypress, Playwright, Git, Agile
